

serious **#js**
to **infinity** and beyond!

<http://addyosmani.github.io/backbone-fundamentals/>

assignment

Gegeven is **Match** met de volgende attributen:
homeMatch, homeClub, awayClub, stadium, city.

Maak van **Match** een model in backbone.

readings

model

(vids 1.1 - 2.3)

assignment

Gegeven is model **Match** met de volgende attributen: homeMatch, homeClub, awayClub, stadium, city.

Maak van het model **Match** een **view** in backbone.

assignment

Gegeven is model **Match** met de volgende attributen: homeMatch, homeClub, awayClub, stadium, city.

Maak binnen de view gebruik van een template die een li rendered.

readings

view / template

(vids 2.4 - 2.6)

assignment

Gegeven is model **Match** met de volgende attributen: homeMatch, homeClub, awayClub, stadium, city.

Maak een click event in de view van het model Match die de achtergrond kleur van het li element toggled.

readings

events

(vids 3.1 - 3.4)

assignment

Gegeven is model **Match** met de volgende attributen: homeMatch, homeClub, awayClub, stadium, city.

Maak van het model **Match** een **collection** (Matches) in backbone. (hardcode json)

Probeer de collection van de url '<http://docent.cmi.hr.nl/moora/imp03/api/wedstrijden>' uit te lezen

readings

collection

<http://backbonetutorials.com/what-is-a-router/#/posts/130>

Web applications often provide linkable, bookmarkable, shareable URLs for important locations in the app. Until recently, hash fragments (#page) were used to provide these permalinks, but with the arrival of the History API, it's now possible to use standard URLs (/page).

```
//Example router with custom routes
var Router = Backbone.Router.extend({
  routes: {
    'books/:book': 'bookAction',
    'test/:test/:more': 'testAction' //Possible to create bigger urls
  },

  /**
   * Route callback
   *
   * @param book
   */
  bookAction: function (book) {
    //Do something with book.
  }
});
```

```
//Enables history for routing state  
Backbone.history.start();
```

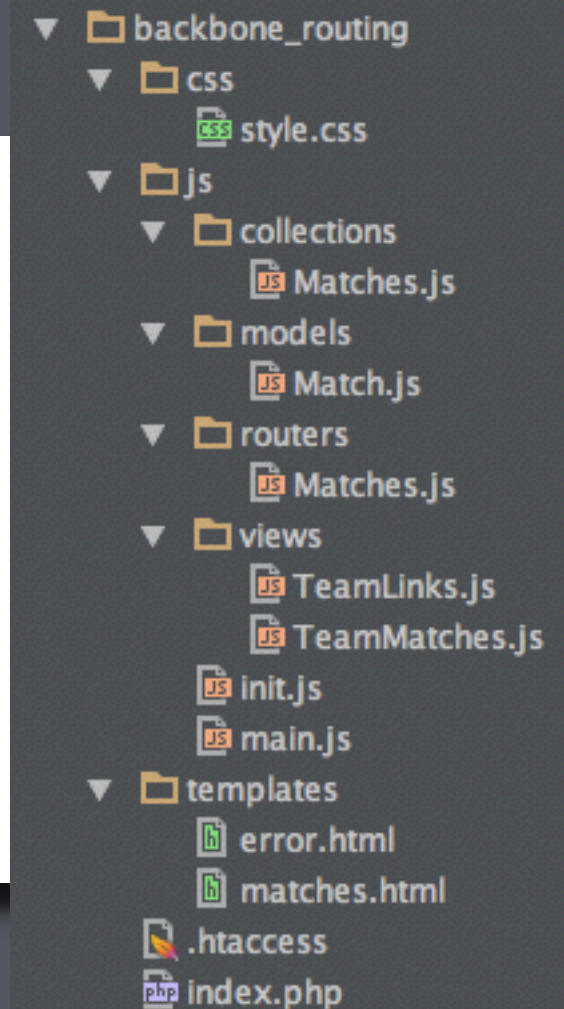

#JS - BACKBONE HISTORY

code

Note that using real URLs requires your web server to be able to correctly render those pages, so back-end changes are required as well. For example, if you have a route of /documents/100, your web server must be able to serve that page, if the browser visits that URL directly.

For full search-engine crawlability, it's best to have the server generate the complete HTML for the page ... but if it's a web application, just rendering the same content you would have for the root URL, and filling in the rest with Backbone Views and JavaScript works fine.

```
//init.js
(function () {
    window.site = {};
    site.$document = $(document);
    site.views = {};
    site.collections = {};
    site.models = {};
    site.routers = {};
    site.events = _.clone(Backbone.Events);
})();
```

#JS - JS STRUCTURE

code

assignment

Gegeven is model **Match** met de volgende attributen: homeMatch, homeClub, awayClub, stadium, city.

Breidt de MatchesListView zo uit dat op basis van de routing dynamisch de wedstrijden worden ingeladen.

- Routing op basis van **/matches/:league/:club**
- Haal **data** van het team op door de url te veranderen.
 - ~/index.html#league/PremierLeague/Arsenal
- **Toon matches** op scherm.
